

REMODELS

Renovations are projects wherein the structure is being restored or repaired. Renovations are somewhat synonymous with remodeling, however the goal of a remodel is to change the structure, while the goal of a renovation is to repair the structure. Some renovations are subtle, hyper focused on a specific element, and some renovations are more substantial and overlap with remodels.

RIP OUT & REINSTALL

Another type of project similar to remodeling is retrofitting. With this type of project, you are adding something new to the original building or structure, however the goal of a retrofit is to specifically improve the functionality of the building by adding new technology, building systems, or equipment. Conversely, remodeling tends to be more focused on the aesthetics and appearance rather than purely functionality.

NEW CONSTRUCTION-GROUND UP

New construction projects are very straightforward: constructing a new building or structure from the ground up. This type of project, although simple in terms of definition, is very unique from one project to the next. Most often a new construction project requires working with architects, builders, construction teams and general contractors at a minimum.
